4	be	<b>5</b>

### 1 Introduction

These notes<sup>1</sup> are ultimately about the verb that in English is called (to) be. I came to write these notes because of a tendency that seems more prevalent in British than in American English. A supplement to the (British) *Guardian Weekly* in 2005 contained the following sentence:

[Angel's] boyfriend, Benson, insisted that she had the baby when she belatedly discovered she was pregnant at six months.<sup>2</sup>

The word had here is to me quite startling; I would say that Benson insisted that Angel *have* the baby. As it is, the quotation suggests to me that, when Angel discovered she was pregnant, she *already* had a baby, and Benson was insisting that this was true. But this is not what was intended: Benson was insisting on a future act, not a present state.

In a word, I think the *subjunctive* form have should have been used, rather than the *indicative* form had. In a similar situation, a subjunctive form of be is used, for example, in an American novel of 1927:

<sup>&</sup>lt;sup>1</sup>I originally composed these notes in 2005; I have done some editing since.

<sup>&</sup>lt;sup>2</sup>Guardian Weekly, July 1–7, 2005: 'Hear Africa 05' supplement, p. 3: '1—Angel Swartbooi, Born: 02.06.05, South Africa', by David Beresford and Ellen Elmendorp.

Worse things were said of her, and petitions were afloat that she be locked up.<sup>3</sup>

If the *Guardian* writers had written this, they might have said petitions were afloat that she *was* locked up.

Have and had seem to be different forms of the same word, whereas be and was appear to be completely different words. However, we understand be and was to be versions of the one verb (to) be. How did this come about?

What *is* the history of **be**, and how did it come to have so many forms? Accounts of **be** can be found on the web.<sup>4</sup> Most of my historical information is second hand, and I try to name my sources. This means there are many references to the original Oxford English Dictionary [OED] in particular; I check these against the web version<sup>5</sup> of the second edition (1989).

#### 2 Grammar

I shall use standard grammatical terminology; but I want first to say something about what the terms mean, as I see them.<sup>6</sup> A simple **sentence** involves

- 1. a speaker,
- 2. a listener (or listeners), and
- 3. (usually) a **subject** (that is, a *real* subject, which will be referred to by the *grammatical* subject).

Some sentences have no subject: such sentences are *imperative*, as will be discussed below in the context of *mood*; meanwhile, let us consider a sentence with a subject. A certain part of this sentence is called a (grammatical) subject; this *names* or otherwise distinguishes the real subject. The grammatical subject also indicates the **person** of the sentence: that is, it tells something about the relation between the subject, the listener, and the speaker. I am treating person as a feature of the whole *sentence*, not just of parts of the sentence. The person is called:

- 1. first, if the speaker and subject are identical;
- 2. second, if the listener and subject are identical;

<sup>&</sup>lt;sup>3</sup>Thornton Wilder, *The Bridge of San Luis Rey*, p. 15 in the Penguin edition. <sup>4</sup>http://www.etymonline.com/columns/tobe.htm, 2005.07.11;

http://en.wiktionary.org/wiki/be, 2005.07.12.

<sup>&</sup>lt;sup>6</sup>How I see them is inspired in part by the manual of ancient Greek by Molin and Williamson that was in use at St John's College in Annapolis when I was a student there in the 1980s. However, I have not looked at that manual in many years.

#### 3. third, otherwise.

Actually, person is not quite so simple, since a sentence also has a **number**. In English, the number is:

- 1. **singular**, if the subject is conceived as one entity;
- 2. plural, if more than one.

The subject of a plural sentence can be thought of as a *class;* then the person of a plural sentence is:

- 1. first, if the speaker is a member of that class;
- 2. **second**, if the listener or listeners are included in the class, but the speaker is not;
- 3. third, otherwise.

A sentence says something about its subject, namely, something that has a *time* in relation to the uttering of the sentence; this time-relation is indicated by the **tense** of the sentence, which can be **present** or **past** or (sometimes) **future** (or sometimes variations on these).

Let us say that what the sentence says about its subject (if it has one) is an *event*. The tense of the sentence concerns the relation between the event and the uttering of the sentence. This utterance is an *interaction* between the speaker and listener. The sentence also says something about the event in its relation to the speaker alone. What it says is called the **mood** (or **mode**) of the sentence; this mood is, in English:

- 1. indicative, if the event is real for the speaker;
- 2. **subjunctive,** if the event is not real (but rather hypothetical, wished for, and so forth), and there is a subject;
- 3. **imperative**, if there is no subject.

By this account, imperative sentences have no tense or person. They have a number, which is singular if the listener is one entity, and plural, if more than one. It may be said that an imperative sentence, in the present sense, is in the *second* person, since a sentence like 'God bless you' is a third-person imperative. However, I shall just refer to such a sentence as subjunctive, in contrast with 'God blesses you,' an indicative.

Some verb-forms have no person or number, but do have tense: these are the **participles** (such as going and gone). Other verb-forms do not even have tense: the **infinitive** (to go) and the **gerund** (going).

In English, distinctions of person and number *can* be indicated by (**personal**) **pronouns**; first and second persons *must* be so indicated. Two numbers and three persons would seem to make six kinds of personal pronoun; however, English has lost its second-person singular, and the former

	singular	plural
first	I	we
second	(thou)	(ye,) you
third	she/he/it	they

Table 1: Personal pronouns

plural now does duty for both numbers. However, since the old singular retains a vestigial presence in the current language, it is listed parenthetically in Table 1 below.

English is said to be one of the descendents of a common **Germanic** (or 'Teutonic') language, which in turn was one of the descendents of **Indo-European** (IE); but Germanic and Indo-European were not written down, so words supposed to have belonged to them are sometimes written with asterisks to indicate their hypothetical status.

Indo-European and Germanic **verbs** seem to have exhibited all of the distinctions of person and number. Verbs of current English do *not* exhibit these distinctions, and it seems foolish to tabulate their forms as if they did.

I am not going to talk about the compound verbs formed with various **auxiliaries.** Still, three persons, two numbers, two tenses, and two moods would seem to make 24 possibilities; this is not counting the two numbers for an imperative; the two tenses for a participle; the infinitive; and the gerund; that makes 30 possible forms.

## 3 English verbs

A regular English verb like walk has four forms—five, if you count an archaic form:

- 1. second-person singular present indicative (archaic): walkest;
- 2. third-person singular present indicative: walks;
- 3. present participle, and gerund: walking;
- 4. past: walked;
- 5. other: walk.

I am ignoring the archaic alternative third-person singular walketh. I am not treating the infinitive phrase to walk separately from walk.

I do not know why, in the current language, with all of the distinctions possible among the present indicative, subjunctive, and imperative verbs, the third-person singular indicative alone retains a special form. This form can be usefully contrasted with the subjunctive:

- 1. 'He insists that he walk'—he will not accept a ride.
- 2. 'He insists that he walks'—he denies taking taxis.

But the subjunctive is obsolescent. (The first sentence does not sound so natural to me as the equivalent 'He insists on walking.')

In some verbs, the past participle is distinct from the other past forms, and there are five forms in all: sings, singing, sang, sung, sing. Other verbs collapse distinctions, showing only three forms: puts, putting, put. One verb represents the coalescence of two from the ancestral language, but still exhibits only five forms: goes, going, went, gone, go.

### 4 be

In a class by itself is **be**, with eight forms currently, and one more that is archaic:

- 1. present:
  - (a) indicative:
    - i. singular:
      - A. first person: am
      - B. (second person: art)
      - C. third person: is
    - ii. plural: are
  - (b) subjunctive (and imperative, and infinitive): be
  - (c) participle (and gerund): being
- 2. past:
  - (a) first- and third-person singular indicative: was
  - (b) other indicative, and subjunctive: were
  - (c) participle: been

By the account of [OED] and [HMK], these are the remnants of three verbs in Indo-European:

- 1. From \*(e)s- come am, is, are;
- 2. from \*wes- come was, were;
- 3. from \*bheu- come be, being, been.

present indicative:	eom	am	bēo	be
	eart	art	bist	beest
	is	is	biþ	beeth
	sind(on), earun	are	bōþ	be
present subjunctive	sie		bēo	be
	sīen		bēon	be
imperative:	wes		bēo	be
	wesaþ		bēoþ	be
infinitive:	wesan		bēon	be
present participle:	wesende		bēonde	being
past indicative:	wæs	was		
	wære	wert		
	wæron	were		
past subjunctive	wære	were		
	wæren	were		

Table 2: Forms of the substantive verb in Old and modern English

A more recent authority [COD] traces **are** to a different source; on the web<sup>7</sup> the source is said to be IE **\*her**.

By the account of [OED], es- was the 'Aryan' (that is, Indo-European) substantive verb, but it had only present forms in 'Teutonic' (Germanic) languages like English. In another Germanic language, Gothic, wes- was a separate complete verb with the meaning of 'remain, stay,' and hence 'continue to be.' Old English (OE, that is, English before the Norman Invasion of 1066) took the past forms of wes- and treated them as past forms of es-, thus creating a complete verb that we might call am-was. Meanwhile, in Old English, be was a distinct verb with no past forms, with the meaning of 'become, come to be'; hence its present forms could (and did) serve as a *future* tense for am-was. Later, by the beginning of the 13th century, forms of be supplanted some forms of am-was. Eventually, a past participle from be was introduced (there was none in Old English).

The following Old-English forms are from [HMK]; many variants are given in [OED]. In brackets I give the modern form of the word, if it exists, followed by cognate forms in Greek and Latin (because they are familiar to me), though not in other Germanic tongues (because they are not familiar to me). The forms themselves are summarized in Table 2.

- 1. Forms from es-:
  - (a) present indicative:

i. singular:

<sup>&</sup>lt;sup>7</sup>http://en.wikipedia.org/wiki/Indo-European\_copula, 2005.07.11

A. first: eom [am,<sup>8</sup>  $\epsilon i \mu i$ , SVM]

B. second: eart [art,  $\epsilon \hat{i}$ , ES]<sup>9</sup>

- C. third: is  $[is, \epsilon \sigma \tau i, EST]^{10}$
- ii. plural (all persons):
  - A. from 's-: sind(on),<sup>11</sup> sint  $[\epsilon i \sigma i, \text{SVNT}]^{12}$
  - B. from es-: earun<sup>13</sup> [are,  $\epsilon \sigma \mu \epsilon \nu$ ,  $\epsilon \sigma \tau \epsilon$ ,  $\epsilon \bar{a} \sigma \iota$ , ESTIS]<sup>14</sup>
- (b) present subjunctive<sup>15</sup>:
  - i. singular (all persons<sup>16</sup>): sie [SĪM, SĪS, SĪT]
  - ii. plural: sīen [SĪMVS, SĪTIS, SĪNT]<sup>17</sup>
- 2. Forms from wes-:
  - (a) imperative:
    - i. singular: wes
    - ii. plural: wesaþ
  - (b) infinitive: wesan
  - (c) present participle: wesende
  - (d) past indicative:
    - i. first- and third-person singular: wæs [was<sup>18</sup>]
    - ii. second-person singular: wære [were<sup>19</sup>]

<sup>11</sup>The **-on** is a second plural suffix, occurring in West Germanic [OED].

 $^{13}\mathrm{I}$  do not find this word in [HMK]; says [OED], it was a re-formation from the full es-, but was used only in Anglian dialects, alongside the formation on 's-.

<sup>16</sup>A form peculiar to the first person was possible: siēm or siōn [OED].

<sup>17</sup>To sīMVS can be compared the optative  $\epsilon i\eta\mu\epsilon\nu$ , from  $\epsilon\sigma i\mu\epsilon\nu$  [Smyth].

 $^{\scriptscriptstyle 18}{\rm In}$  dialect, were and war are used [OED].

<sup>19</sup>This is the etymological form; the analogical form wast is found in Tindale and the 1611 Bible; in Shakespeare is the intermediate form wert [OED].

<sup>&</sup>lt;sup>8</sup>This is the sole survival in English of the personal suffix -m [OED].

<sup>&</sup>lt;sup>9</sup>According to [OED], the s in the root became r, and the t represents the second-person pronoun; but this formation is not found in Gothic, or outside Germanic. However, art is traced in [COD] to the hypothetical Germanic base \*ar-.

<sup>&</sup>lt;sup>10</sup>Since Middle English, is has been used in the north of England for all singular persons, and in the plural, when the subject is a noun or a relative pronoun; such usage is frequent in Shakespeare's folio of 1613 [OED].

<sup>&</sup>lt;sup>12</sup>The Greek  $\epsilon i \sigma i$  is not mentioned in [OED], but according to [Smyth], it represents  $\sigma \epsilon \nu \tau i$  and can be compared with SVNT—which [OED] does mention. Both of these verbs are third person.

<sup>&</sup>lt;sup>14</sup>The persons of the Greek and Latin forms are, respectively, first, second, Homeric third [Smyth], and second.

<sup>&</sup>lt;sup>15</sup>The subjunctive was originally an optative [OED]; see Note 17.

iii. plural: wæron [were<sup>20</sup>]

- (e) past subjunctive:
  - i. first- and third-person singular: wære [were]
  - ii. second-person singular: wære [wert<sup>21</sup>]
  - iii. plural: wæren [were<sup>22</sup>]
- 3. Forms from be:
  - (a) present indicative:
    - i. singular<sup>23</sup>:
      - A. first person:  $b\bar{e}o^{24}$  [be,  $\phi\dot{\upsilon}\omega$ , FUI]
      - B. second person: bist<sup>25</sup> [beest]
      - C. third person:  $bi\beta^{26}$  [beeth, bes]
    - ii. plural: bēþ [be<sup>27</sup>]
  - (b) present subjunctive<sup>28</sup>:
    - i. singular: **beo** [be<sup>29</sup>]
    - ii. plural: **bon** [be]
  - (c) imperative:
    - i. singular: **beo** [be]
    - ii. plural: **bēoþ** [be]

<sup>21</sup>Formerly were; the -t is by analogy with the indicative; also, was was common in the 17th–18th cc., when this was even used as a plural form by those who used it also as an indicative plural [OED].

<sup>22</sup>See Note 21.

<sup>23</sup>These forms are said to be regular in the dialect of southern England [OED].

 $^{\rm 24} {\rm Usually}$  with future meaning [OED].

<sup>25</sup>Usually with future meaning [OED].

 $^{\rm 26}{\rm Future}$  or present meaning [OED].

 $^{27}$ Before 1250, this replaced sind(on) in the South and became standard for centuries; we see it in 'the powers that be' [OED].

<sup>28</sup>Indicative forms have been substituted for imperative occasionally since the 15th c., and are now usually used after if, though, unless, etc.; consider the 1611 Bible, I John 4:1: 'Try the spirits whether they are of God' [OED].

<sup>29</sup>In the second person, after if, though, etc., beest was common in the 16th–17th cc. [OED]. Indeed, consider John Donne:

If thou beest born to strange sights,

Things invisible to see,

Ride ten thousand days and nights,

Till age snow white hairs on thee...

and note that 'snow' here is a subjunctive verb.

 $<sup>^{20}\</sup>mathrm{In}$  the 16th–18th cc., was used almost universally with you, if this was used for one listener [OED].

- (d) infinitive:
  - i. **bēon** [be]
  - ii. to beonne [to be]
- (e) present participle: beonde [being]
- (f) past participle: (ben(e)<sup>30</sup>) [been<sup>31</sup>]
